

Supplemental Materials for “Large parks and city-wide tree cover boost butterfly diversity across 22 major U.S. cities”

Authors: Jens Ulrich, Yan Yin Jenny Cheung, Christopher T. Cosma, Heather Kharouba, Laura Melissa Guzman

Butterfly Species Included in Occupancy Models. Our analyses included 183 different butterfly species from five different butterfly families. Species are listed by alphabetical order within family. We modeled butterfly species occupancy within cities that were considered to be within the geographical range. We considered a city to be within range if the species was detected by iNaturalist users at least once in a park in the city, or if the species was detected by iNaturalist users at least once anywhere within a 20 km buffer of the city administrative boundary. Cities determined to be within range of each species are listed under 'Cities' column. *n* indicates the number of unique (park by month by year) detections of each species in our dataset. Duplicate detections of the same species from the same time and place were not counted. The *n* detection counts are coloured from lowest (dark colours) to highest (light colours).
